What are the three pieces of evidence for the endosymbiotic theory? Evidence for the Theory of Endosymbiosis can be found in the DNA of mitochondria and chloroplasts, the way the organelles reproduce, and the internal structure and biochemistry of the organelles.

How is endosymbiotic evidence for evolution? 1: Endosymbiosis: Modern eukaryotic cells evolved from more primitive cells that engulfed bacteria with useful properties, such as energy production. Combined, the once-independent organisms flourished and evolved into a single organism.

What evidence exists that supports the endosymbiotic theory Quizlet? The endosymbiotic theory is based on mitochondria and chloroplasts of eukaryotes. Both structures have characteristics (such as their own DNA and the ability to self-replicate) of independent prokaryotes.

Which discovery supported the endosymbiotic theory? Answer and Explanation: The discovery of independent DNA (from the host) in mitochondria and chloroplasts supports the endosymbiotic theory. Mitochondria are able to grow and reproduce independently without needing help from the host's nucleus.

What is the strongest evidence for the endosymbiotic origin? Protein import is the strongest evidence we have for the single origin of chloroplasts and mitochondria. It is probably also the strongest evidence we have to sort out the number and nature of secondary endosymbiotic events that have occurred in evolution involving the red plastid lineage.

Which is not one of the 4 evidences for endosymbiotic theory? The chromosome similarity of organelles (mitochondria and chloroplast) does not support the endosymbiotic theory and having non-coding DNA.

What is a modern day example of endosymbiosis? Examples are nitrogen-fixing bacteria (called rhizobia), which live in the root nodules of legumes, single-cell algae inside reef-building corals, and bacterial endosymbionts that provide essential nutrients to insects.

Which organelles provide evidence for the theory of endosymbiosis? Endosymbiotic theory goes back over 100 years. It explains the similarity of chloroplasts and mitochondria to free-living prokaryotes by suggesting that the organelles arose from prokaryotes through (endo)symbiosis.

Which statement provides evidence for endosymbiosis? Final answer: Mitochondria and chloroplasts contain DNA similar to prokaryotic DNA, providing evidence for the endosymbiotic theory.

Which two statements best support the endosymbiotic theory? Final answer: The endosymbiotic theory is supported by two statements: chloroplasts and mitochondria have their own ribosomes, and the enzymes in their inner membranes are similar to those in prokaryotic cells.

Which evidence supports the endosymbiotic theory for the origin of mitochondria?

Endosymbiotic theory is an amazing fact in the evolution. There are many strong evidences which support this theory. Mitochondria and chloroplast have their own circular DNA which replicates independent of the genomic DNA. Size of mitochondria and chloroplast is similar to that of prokaryotic cells.

Which of the following is evidence to support the endosymbiotic theory responses? The endosymbiotic theory is supported by multiple lines of evidence, including the fact that mitochondria and chloroplasts possess their own genomes, are surrounded by double membranes, and divide through a process that is similar to bacterial fission (mitosis).

What evidence is there to support the endosymbiotic theory? The evidence to support the endosymbiotic theory is that mitochondria and chloroplast have their own DNA and are capable of reproducing independently from the cell. Furthermore, they are the same size of a prokaryotic cell. Prokaryotic cells are smaller than eukaryotic cells.

What are the three main sources of evidence for endosymbiosis?

Who proved endosymbiotic theory? The endosymbiotic theory was articulated in 1905 and 1910 by the Russian botanist Konstantin Mereschkowski, and advanced and substantiated with microbiological evidence by Lynn Margulis in 1967.

What are 3 facts that support the theory of endosymbiosis?

What are the three main points of the endosymbiotic theory?

Which statement best explains the evidence for the endosymbiotic theory? Final answer: The statement 'All mitochondria have circular DNA' best supports the Endosymbiotic Theory as it is evidence that suggests mitochondria were once independent prokaryotic organisms.

Which of the following statements shows evolutionary evidence for the endosymbiotic theory?

Final answer: The endosymbiotic theory is supported by evidence such as the presence of own DNA and ribosomes in chloroplasts and mitochondria, suggesting their past existence as independent prokaryotic organisms.
